

The manufacturer of biological and nanotechnology goods, [Tropical Agro System India Pvt. Ltd.](#), has released a new biological product for farmers called Tag Carb-N. Since a few years ago, the use of chemical fertilisers has been steadily rising while that of organic fertilisers like cow dung and earthworm manure has been declining. As a result, the amount of carbon in Indian soils has decreased to between 0.3 and 0.5 percent.

Rajiv Kumar Sisodia, Senior Development Manager of Tropical Agro informs, “Tag Carb-N is a complete organic product. The use of this product will increase the income of the farmers. It contains twenty-five percent organic carbon and six percent organic nitrogen. Tag Carb-N contains a unique protein and a complete blend of primary and secondary nutrients and micronutrients”.

Sisodia adds, “The use of Tag Carb-N increases the number of micro-organisms found in the root zone (rhizosphere) of plants. Due to which the amount of essential nutrients in the crops increases. Continuous use of this product increases the living capacity of the soil. In addition, the growth of the crop is also good. It also helps in increasing production. This product is suitable for all crops. We can use it in the soil before sowing the crop and in the growing stage of the crop. This product forms a layer on top of chemical fertilisers and is released as

per the requirement of the plants”.
